

Boom Lifts

Boom lifts are equipment that has a platform that could be lowered or raised to many heights, thus making this piece of equipment an important necessity in a wide variety of professions. Offered in quite a few specific types such as aerial hoists, scissor lifts, and knuckle boom lifts, each type functions very specifically.

Aerial platform lifts are most regularly utilized to carry people at skiing lodges who are not at ease with a ski lift. These lifts function much like an elevator, snowboarders can be slowly but surely moved up the mountain, stopping at stations along the way until they contact the top. Aerial platform lifts are also used in construction, transporting workers securely up and down the sides of multi-level construction sites.

Scissor hoists are quite often used by service providers as the perfect approach to securely facilitate staff to mend and work on cables and wires attached to poles. Telephone, cable television and power providers have relied on the proficiency of this style of boom jack for years.

The knuckle boom lift is made for use within areas of rough terrain and where the need to reverse direction may be necessary. This kind of boom jack has the capability to fit in tight spots where a scissor lift cannot fit. Working between numerous machines in a production plant or in near proximity stuck between two walls, the knuckle boom also features a standard platform fitted with rails for security and worker safety.

Depending on the work requirements and the sort of job to be completed will establish the right type of boom lift to decide on. Fortunately, there is a model suited for practically any application.
